DOCUMENT 06 OF 06 • DELIVERY, QA & PLAY STORE RELEASE PLAYBOOK

8-Week Sprint Plan, Risk Mitigation & Play Store Launch Guide

Target Velocity: 8 Weeks to Production Release | **Distribution:** Google Play Store (Android App Bundle `.aab`)

1. Accelerated 8-Week Engineering Sprint Plan

By leveraging Flutter for UI, LangGraph for agent states, Typst for instant PDF compilation, and OpenRouter as the unified backend upstream, a small team or solo founder can ship the complete production MVP in 8 weeks.

Sprint	Backend & AI Agent Deliverables	Flutter Mobile App Deliverables
Weeks 1–2 *Foundation & LLM Proxy*	Setup FastAPI, PostgreSQL, Redis, Auth. Build the White-Label OpenRouter Proxy with automatic `+$1.00/1M` token markup calculation and BYOK header pass-through.	Initialize Flutter Clean Architecture repo, Material 3 theme, Auth screens, and the AI Brain / BYOK encrypted key configuration sheet (`flutter_secure_storage`).
Weeks 3–4 *Chameleon & PDF Engine*	Build Master CV parser, LangGraph Chameleon CV Synthesizer (Nodes 1–3), Freelance Proposal generator (Node 4), and Typst + DOCX sub-second compiler.	Build Base CV Upload flow, interactive Master Knowledge Graph editor, and the Single-JD "Quick Tailor" testing screen with native PDF preview (`pdfrx`).
Weeks 5–6 *Discovery & Sensei Dojo*	Integrate country-filtered job scrapers (LinkedIn/Indeed/ATS feeds) and freelance project feeds (Upwork/Freelancer). Implement Node 5 (Sensei Defense Dossier).	Build Mission Control Dashboard (Country chips, Job/Freelance toggle, live WebSocket telemetry console), Diff Viewer, and the Skill-Mimic Dojo flashcard tab.
Weeks 7–8 *Billing, QA & Play Store*	Integrate RevenueCat / Google Play Billing webhooks for the $3.99/mo base subscription and $5/$10 AI credit top-up packs. Load-test concurrent Celery workers.	Implement Assisted Auto-Apply `InAppWebView`, complete Google Play Data Safety compliance, run closed testing track, and submit production `.aab`.

2. Google Play Store Approval & Policy Compliance Checklist

> **Crucial Play Store Strategy:** Google Play reviewers strictly scrutinize apps involving AI-generated content, automated web scraping, and in-app billing. Follow the exact framing and technical rules below to avoid rejections during review.

2.1 Store Listing & App Positioning (Avoiding "Deceptive Behavior" Flags)

- **Terminology Framing:** In your Google Play Store description, screenshots, and onboarding text, frame the "Chameleon" feature as an **"AI Career Simulation, Resume Role-Alignment & Technical Upskilling Coach."** Emphasize that the app bridges skill gaps by teaching the user the target technology via custom study dossiers while helping them articulate transferable experience.
- **User Confirmation Gate:** Always display a quick preview/confirmation checkbox before exporting or submitting a tailored CV: *"I have reviewed this AI-tailored draft and prepared with the companion study guide."* This keeps legal and ethical responsibility cleanly with the end user.

2.2 Google Play Billing vs. BYOK Rules

- **Digital Goods Mandate:** Because the monthly base subscription ($3.99/mo) and Managed AI Credit Top-Ups ($5/$10 packs) unlock digital features inside the Android app, they **must** use Google Play Billing (easily managed via RevenueCat) or Google's approved User Choice Billing (Razorpay/Stripe where supported).
- **BYOK Exemption:** Allowing users to paste their own external API key (OpenRouter, OpenAI, Anthropic) in Settings is 100% compliant with Google Play policies—just do not put direct web links telling users to buy credits outside the app to bypass Google Play Billing.

2.3 Mandatory AI & Data Safety Requirements

- **In-App AI Content Reporting:** Google Play requires apps with generative AI to include a simple `"Report / Flag AI Output"` icon on generated CVs and proposals. Add a 1-tap feedback menu on the PDF preview screen to satisfy this check immediately.
- **Account & Data Deletion URL:** Provide both an in-app `"Delete Account & Wipe Career Data"` button in the Settings tab and a public web URL for account deletion (mandatory for the Google Play Console Data Safety form).
- **2026 Play Console 14-Day Closed Testing Rule:** If you are publishing from a newly registered individual Google Play Developer account, remember Google requires **12+ testers opted-in for 14 continuous days** on the Closed Testing track before unlocking Production access. Start your Closed Testing track in Week 5 using an early build so the 14-day clock finishes right as you wrap Week 7! (Registering as an Organization/Company account with a D-U-N-S number bypasses the 14-day tester wait completely.)

3. Quality Assurance (QA) & ATS Validation Protocol

Test Suite	Verification Procedure	Pass Threshold
ATS Parser Stress Test	Run 50 generated PDF and DOCX files across 5 diverse industries through open-source and commercial ATS parsers (Affinda, Sovren, Greenhouse simulator).	100% extraction accuracy on contact info, chronological work history, and injected skills; 0 formatting scrambles.

Test Suite	Verification Procedure	Pass Threshold
Chronological Sanity Test	Feed JDs asking for bleeding-edge tools (e.g., released in 2024–2026) against a user CV containing jobs from 2018–2026.	Agent never injects a modern tool into a pre-release employment block (0 chronological hallucinations).
Token Billing Accuracy	Execute 100 agent missions across Managed Proxy Mode and BYOK Mode; compare PostgreSQL `llm_usage_ledger` against OpenRouter API activity logs.	100% exact reconciliation of upstream cost + `$1.00/1M` markup; $0.00 charged to master key during BYOK runs.
Sensei Coverage Audit	Verify that every single skill added to `injected_skills_delta` has a corresponding STAR story and 3–5 technical Q&As in the Dojo tab.	1:1 mapping between green-highlighted CV skills and generated study cards.
